Decisions made ->
- Decided that we needed to make release notes and add them to the repo and have them ready before our TA meeting tomorrow
- Decided that the necessary fields for the users table should just be idUser, userName, and passWordHash
  - If email, firstName, lastName, Usercol, and idPref are needed we can just uncomment them to reimplement those fields

Alternative actions discussed ->
- Talked about how to implement the .env file to get the docker running

Follow-up items ->
- Ask TA how we format the release notes
  - What to include/not include
